Work with strings with stringr:: cheat sheet

The stringr package provides a set of internally consistent tools for working with character strings, i.e. sequences of characters surrounded by quotation marks.

Detect Matches

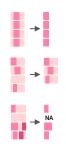

str_detect(string, **pattern**) Detect the presence of a pattern match in a string. str detect(fruit, "a")

str_which(string, **pattern**) Find the indexes of strings that contain a pattern match. *str which*(*fruit*, "a")

str_count(string, **pattern**) Count the number of matches in a string. str_count(fruit, "a")

str_locate(string, **pattern**) Locate the positions of pattern matches in a string. Also **str_locate_all**. *str_locate*(*fruit*, "a")

Subset Strings

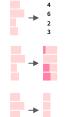

str_sub(string, start = 1L, end = -1L) Extract substrings from a character vector. str_sub(fruit, 1, 3); str_sub(fruit, -2)

str_subset(string, **pattern**) Return only the strings that contain a pattern match. *str subset*(*fruit*, "b")

str_extract(string, **pattern**) Return the first pattern match found in each string, as a vector. Also **str_extract_all** to return every pattern match. *str_extract(fruit, "[aeiou]")*

str_match(string, **pattern**) Return the first pattern match found in each string, as a matrix with a column for each () group in pattern. Also **str_match_all**. str_match(sentences, "(a|the) ([^]+)")

Manage Lengths

str_length(string) The width of strings (i.e. number of code points, which generally equals the number of characters). *str_length(fruit)*

str_pad(string, width, side = c("left", "right", "both"), pad = " ") Pad strings to constant width. $str_pad(fruit, 17)$

str_trunc(string, width, side = c("right", "left",
"center"), ellipsis = "...") Truncate the width of
strings, replacing content with ellipsis.
str_trunc(fruit, 3)

str_trim(string, side = c("both", "left", "right")) Trim whitespace from the start and/or end of a string. $str_trim(fruit)$

Mutate Strings

A STRING

a string

a string

a string

★ A String **str_sub**() <- value. Replace substrings by identifying the substrings with str_sub() and assigning into the results. str_sub(fruit, 1, 3) <- "str"

str_replace(string, **pattern**, replacement) Replace the first matched pattern in each string. str_replace(fruit, "a", "-")

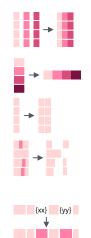

str_replace_all(string, **pattern**, replacement) Replace all matched patterns in each string. str_replace_all(fruit, "a", "-")

str_to_lower(string, locale = "en")¹ Convert
strings to lower case.
str_to_lower(sentences)

str_to_upper(string, locale = "en")¹ Convert strings to upper case. str_to_upper(sentences)

str_to_title(string, locale = "en")¹ Convert strings to title case. *str_to_title*(*sentences*)

Join and Split

str_c(..., sep = "", collapse = NULL) Join
multiple strings into a single string.
str_c(letters, LETTERS)

str_c(..., sep = "", **collapse = NULL**) Collapse a vector of strings into a single string. str_c(letters, collapse = "")

str_dup(string, times) Repeat strings times times. *str_dup*(*fruit*, *times* = 2)

str_split_fixed(string, **pattern**, n) Split a vector of strings into a matrix of substrings (splitting at occurrences of a pattern match). Also **str_split** to return a list of substrings. str_split_fixed(fruit, "", n=2)

glue::glue(..., .sep = "", .envir =
parent.frame(), .open = "{", .close = "}") Create
a string from strings and {expressions} to
evaluate. glue::glue("Pi is {pi}")

glue::glue_data(.x, ..., .sep = "", .envir =
parent.frame(), .open = "{", .close = "}") Use a
data frame, list, or environment to create a
string from strings and {expressions} to
evaluate. glue::glue_data(mtcars,
"{rownames(mtcars)} has {hp} hp")

Order Strings

str_order(x, decreasing = FALSE, na_last = TRUE, locale = "en", numeric = FALSE, ...)¹ Return the vector of indexes that sorts a character vector. x[str_order(x)]

str_sort(x, decreasing = FALSE, na_last = TRUE, locale = "en", numeric = FALSE, ...)¹ Sort a character vector. str_sort(x)

Helpers

apple banana pear

apple banana pear **str_conv**(string, encoding) Override the encoding of a string. *str_conv*(*fruit*,"/SO-8859-1")

str_view(string, **pattern**, match = NA) View HTML rendering of first regex match in each string. $str_view(fruit, "[aeiou]")$

str_view_all(string, pattern, match = NA) View
HTML rendering of all regex matches.
str_view_all(fruit, "[aeiou]")

str_wrap(string, width = 80, indent = 0, exdent = 0) Wrap strings into nicely formatted paragraphs. *str_wrap*(*sentences*, *20*)

¹ See bit.lv/ISO639-1 for a complete list of locales.

Need to Know

Pattern arguments in stringr are interpreted as regular expressions after any special characters have been parsed.

In R, you write regular expressions as *strings*, sequences of characters surrounded by quotes ("") or single quotes(").

Some characters cannot be represented directly in an R string. These must be represented as **special characters**, sequences of characters that have a specific meaning., e.g.

Special Character Represents
\\
\"
\"
\n new line

Run?""" to see a complete list

Because of this, whenever a \ appears in a regular expression, you must write it as \\ in the string that represents the regular expression.

Use **writeLines**() to see how R views your string after all special characters have been parsed.

writeLines("\\.")
\.

writeLines("\\ is a backslash")
#\ is a backslash

INTERPRETATION

Patterns in stringr are interpreted as regexs To change this default, wrap the pattern in one of:

regex(pattern, ignore_case = FALSE, multiline = FALSE, comments = FALSE, dotall = FALSE, ...)
Modifies a regex to ignore cases, match end of lines as well of end of strings, allow R comments within regex's , and/or to have . match everything including \n.

str_detect("I", regex("i", TRUE))

fixed() Matches raw bytes but will miss some characters that can be represented in multiple ways (fast). str_detect("\u0130", fixed("i"))

coll() Matches raw bytes and will use locale specific collation rules to recognize characters that can be represented in multiple ways (slow). str_detect("\u0130", coll("i", TRUE, locale = "tr"))

boundary() Matches boundaries between characters, line_breaks, sentences, or words. str_split(sentences, boundary("word"))

Regular Expressions -

Regular expressions, or *regexps*, are a concise language for describing patterns in strings.

MATCH CHARACTERS

see <- function(rx) str view all("abc ABC 123\t.!?\\(){}\n", rx)

MAICHCHARACTERS		HARACIERS	see <- function(ix) sti_view_att(abc Abc 125\thin, ix)		
	string (type	.	matches	example	
	this)	(to mean this)	(which matches this)		
		a (etc.)	a (etc.)	see("a")	abc ABC 123 .!?\(){}
	\\.	\.		see("\\.")	abc ABC 123 .!?\(){}
	//!	\!	!	see("\\!")	abc ABC 123 .!?\(){}
	\\?	\?	?	see("\\?")	abc ABC 123 .!?\(){}
	\\\\	\\	\	see("\\\\")	abc ABC 123 .!?\(){}
	\\(\((see("\\(")	abc ABC 123 .!?\ <mark>(</mark>){}
	\\)	\))	see("\\)")	abc ABC 123 .!?\(){}
	\\ {	\{	{	see("\\{")	abc ABC 123 .!?\(){}
	\\}	\}	}	see("\\}")	abc ABC 123 .!?\(){}
	\\n	\n	new line (return)	see("\\n")	abc ABC 123 .!?\(){}
	\\t	\t	tab	see("\\t")	abc ABC 123 .!?\(){}
	\\s	\s	any whitespace (\S for non-whitespaces)	see("\\s")	abc ABC 123 .!?\(){}
	\\d	\d	any digit (\ D for non-digits)	see("\\d")	abc ABC 123 .!?\(){}
	\\w	\w	any word character (\W for non-word chars)	see("\\w")	abc ABC 123 .!?\(){}
	\\b	\b	word boundaries	see("\\b")	abc ABC 123 .!?\(){}
		[:digit:]	digits	see("[:digit:]")	abc ABC 123 .!?\(){}
		[:alpha:]	letters	see("[:alpha:]")	abc ABC 123 .!?\(){}
		[:lower:]	lowercase letters	see("[:lower:]")	abc ABC 123 .!?\(){}
		[:upper:]	uppercase letters	see("[:upper:]")	abc ABC 123 .!?\(){}
		[:alnum:]	letters and numbers	see("[:alnum:]")	abc ABC 123 .!?\(){}
		[:punct:] ¹	punctuation	see("[:punct:]")	abc ABC 123 .!?\(){}
		[:graph:]	letters, numbers, and punctuation	see("[:graph:]")	abc ABC 123 .!?\(){}
		[:space:]	space characters (i.e. \s)	see("[:space:]")	abc ABC 123 .!?\(){}
		[:blank:] 1	space and tab (but not new line)	see("[:blank:]")	abc ABC 123 .!?\(){}
			every character except a new line	see(".")	abc ABC 123 .!?\(){}

[:space:] new line

[:blank:]

space

tab

[:graph:]

[:punct:]

. , : ; ? ! \ | / ` = * + - ^ _ ~ " ' [] { } () < > @ # \$

ALTERNATES alt <- function(rx) str_view_all("abcde", rx)

regexp	matches	example	
abd	or	alt("ab d")	abcde
abe	one of	alt("[abe]")	abcde
[^abe]	anything but	alt("[^abe]")	ab <mark>cd</mark> e
[a-c]	range	alt("[a-c]")	abcde

ANCHORS

anchor <- function(rx) str_view_all("aaa", rx)

look <- function(rx) str_view_all("bacad", rx)</pre>

¹ Many base R functions require classes to be wrapped in a second set of [], e.g. [[:digit:]]

regexp	matches	example	
^a	start of string	anchor("^a")	aaa
a\$	end of string	anchor("a\$")	aaa

LOOK AROUNDS

example regexp matches a(?=c) followed by look("a(?=c)") bacad a(?!c) not followed by look("a(?!c)") bacad (?<=b)a preceded by look("(?<=b)a") bacad (?<!b)a not preceded by look("(?<!b)a") bacad

QUANTIFIERS

regexp a? a* a+ 1 2 ... n a[n] a[n,] a[n, m]

quant <- function(rx) str_view_all(".a.aa.aaa", rx)

matches

zero or one

quant("a?")

a.aa.aaa

zero or more

quant("a*")

a.aa.aaa

one or more

quant("a+")

a.aa.aaa

exactly n

quant("a{2}")

a.aa.aaa

GROUPS

ref <- function(rx) str_view_all("abbaab", rx)

quant("a{2,}")

quant("a{2,4}")

.a.aa.aaa

.a.aa.aaa

Use parentheses to set precedent (order of evaluation) and create groups

n or more

between **n** and **m**

regexp	matches	example	
(ab d)e	sets precedence	alt("(ab d)e")	abc <mark>de</mark>

Use an escaped number to refer to and duplicate parentheses groups that occur earlier in a pattern. Refer to each group by its order of appearance

string (type this)	regexp (to mean this)	matches (which matches this)	example (the result is the same as ref	("abba"))
\\1	\1 (etc.)	first () group, etc.	ref("(a)(b)\\2\\1")	abbaab
